ABSTRACT OF THE DISCLOSURE

METHOD AND APPARATUS FOR MANAGING AGGREGATE BANDWIDTH AT A SERVER

A method, apparatus, and computer implemented instructions for managing traffic in a network data processing system. Traffic for a plurality of network paths is monitored. In response a packet for a particular network path within the plurality of network paths causing traffic for the particular network path to exceed a level of traffic allowed, an amount of available bandwidth is reduced based on a fair share for the particular network path.
